R build: Geospatial 4.4.0

Analysis of Ace2 dataset from this study

Detailed data are available in Table 1 of the manuscript.

1. Load and Process Species Distribution Models (SDMs)

```
# Load MaxEnt SDMs
sdm_pipiens <- raster("../gis/culex_pipiens_meansuitability.nc")
sdm_quinque <- raster("../gis/culex_quinquefasciatus_meansuitability.nc")
# Threshold to binary
threshold <- 0.5
sdm_pipiens_bin <- sdm_pipiens >= threshold
sdm_quinque_bin <- sdm_quinque >= threshold
```

2. Convert SDMs to Polygons

```
# Raster to terra
sdm_pipiens_v <- terra::rast(sdm_pipiens_bin)
sdm_quinque_v <- terra::rast(sdm_quinque_bin)

# Raster to polygons
poly_pipiens <- terra::as.polygons(sdm_pipiens_v, dissolve = TRUE)
poly_quinque <- terra::as.polygons(sdm_quinque_v, dissolve = TRUE)

# Terra to sf
poly_pipiens_sf <- st_as_sf(poly_pipiens)
poly_quinque_sf <- st_as_sf(poly_quinque)

# Filter to presence only
names(poly_pipiens_sf)[1] <- "presence"
names(poly_quinque_sf)[1] <- "presence"
poly_pipiens_sf <- poly_pipiens_sf %>% filter(presence == 1)
poly_quinque_sf <- poly_quinque_sf %>% filter(presence == 1)
```

3. Project to Albers Equal Area and Calculate Overlap

```
# Define CRS
aea_crs <- st_crs("+proj=aea +lat_1=29.5 +lat_2=45.5 +lat_0=23 +lon_0=-96")

# Project
poly_pipiens_sf <- st_transform(poly_pipiens_sf, aea_crs)
poly_quinque_sf <- st_transform(poly_quinque_sf, aea_crs)

# Overlap
overlap_sf <- st_intersection(poly_pipiens_sf, poly_quinque_sf)

# Calculate areas (km²)
area_pipiens_km2 <- sum(st_area(poly_pipiens_sf)) / 1e6
area_quinque_km2 <- sum(st_area(poly_quinque_sf)) / 1e6
area_overlap_km2 <- sum(st_area(overlap_sf)) / 1e6</pre>
```

4. Clip to North America and Reproject to WGS84

```
# US base map
us_states <- st_as_sf(map("usa", plot = FALSE, fill = TRUE))
us_states <- st_transform(us_states, crs = aea_crs)

# Clip extent
bbox_na <- st_as_sfc(st_bbox(c(xmin = -170, xmax = -50, ymin = 5, ymax = 85), crs = st_crs(4326)))
bbox_na_sf <- st_transform(bbox_na, crs = aea_crs)

# Clip
poly_pipiens_sf <- st_intersection(st_make_valid(poly_pipiens_sf), bbox_na_sf)
poly_quinque_sf <- st_intersection(st_make_valid(poly_quinque_sf), bbox_na_sf)
overlap_sf <- st_intersection(st_make_valid(overlap_sf), bbox_na_sf)

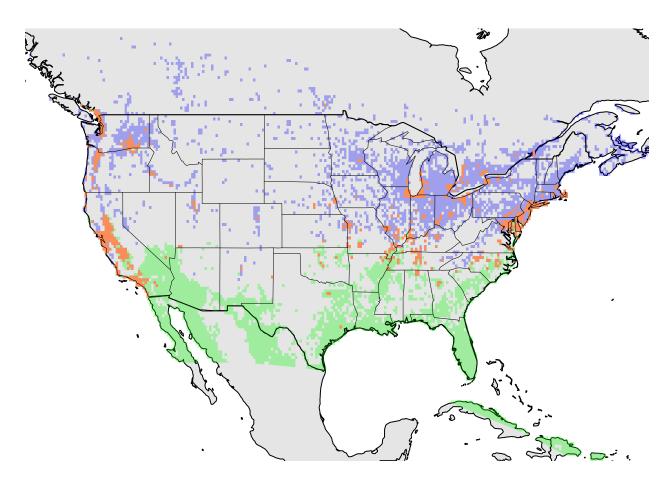

# Reproject to WGS84
poly_pipiens_ll <- st_transform(poly_pipiens_sf, 4326)
poly_quinque_ll <- st_transform(poly_quinque_sf, 4326)
overlap_ll <- st_transform(overlap_sf, 4326)</pre>
```

5. Visualize SDMs and Overlap

```
par(xpd = NA)
map("usa")
map(add = TRUE, col = "grey90", fill = TRUE)

plot(st_geometry(poly_pipiens_ll), col = rgb(0, 0, 1, 0.3), border = NA, add = TRUE)
plot(st_geometry(poly_quinque_ll), col = rgb(0, 1, 0, 0.3), border = NA, add = TRUE)
plot(st_geometry(overlap_ll), col = adjustcolor("#fc8d59", alpha.f = 1), border = NA, add = TRUE)

map("state", add = TRUE, col = "black", lwd = 0.5)
```

6. Merge Nearby Overlapping zones

```
# Reproject overlap
overlap_ll_proj <- st_transform(overlap_ll, aea_crs)</pre>
# Make valid and extract polygons
overlap_valid <- st_make_valid(overlap_ll_proj)</pre>
overlap_polygons <- st_collection_extract(overlap_valid, "POLYGON")</pre>
overlap_parts <- st_cast(overlap_polygons, "POLYGON")</pre>
# Buffer outward
buffer_dist_meters <- 25000</pre>
overlap_buffered <- st_buffer(overlap_parts, dist = buffer_dist_meters)</pre>
overlap_buffered <- st_make_valid(overlap_buffered)</pre>
# Merge touching patches
overlap_combined <- st_union(overlap_buffered)</pre>
overlap_combined <- st_make_valid(overlap_combined)</pre>
# Buffer inward
overlap_combined <- st_buffer(overlap_combined, dist = -buffer_dist_meters)</pre>
overlap_combined <- st_make_valid(overlap_combined)</pre>
# Finalize
overlap_combined <- st_cast(overlap_combined, "MULTIPOLYGON")</pre>
```

7. Visualize Combined Overlap zones

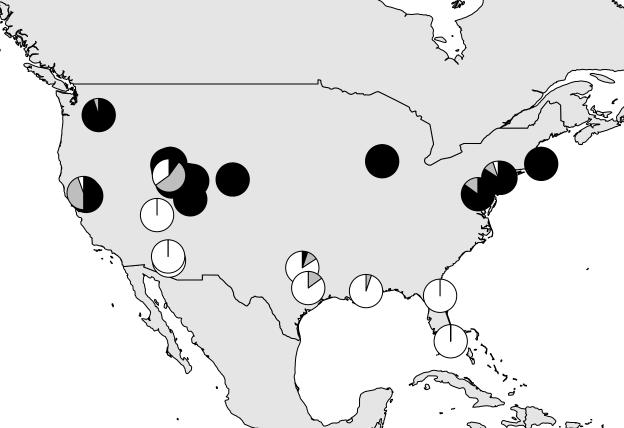

```
#pdf("../figs/overlap_SDM.pdf", width = 8, height = 6)
par(xpd = NA)
map("usa")
map(add = TRUE, col = "grey90", fill = TRUE)
plot(st_geometry(poly_pipiens_ll), col = rgb(0, 0, 1, 0.3), border = NA, add = TRUE)
plot(st_geometry(poly_quinque_ll), col = rgb(0, 1, 0, 0.3), border = NA, add = TRUE)
plot(st_geometry(overlap_combined), col = adjustcolor("#fc8d59", alpha.f = 0.9), border = NA, add = TRU
map("state", add = TRUE, col = "black", lwd = 0.5)
```

8. Add Sampling Points and Population Structure (Pie Charts)

#dev.off()

```
# Load counts
counts <- read.csv("../data/ThisStudy_v9.txt", sep = "\t")
coord <- as.data.frame(counts[,c("long","lat")])</pre>
```

```
# Prepare
countsDf <- as.data.frame(counts[,c(2,1,4,5,6,9,10,7,8)])</pre>
names(countsDf) <- c("locality", "site", "pp", "pq", "qq", "latitude", "longitude", "year", "h_index")</pre>
rownames(countsDf) <- countsDf$site</pre>
# Frequencies
freqsDf <- t(apply(countsDf[,c("pp","pq","qq")], 1, function(row) row / sum(row)))</pre>
freqsDf <- as.matrix(freqsDf)</pre>
# Plot pies
par(xpd = NA)
plot_order <- rev(order(countsDf$h_index))</pre>
map("usa")
map(add = TRUE, col = "grey90", fill = TRUE)
for (i in plot_order) {
  add.pie(z = freqsDf[i,],
          x = coord[i,1],
          y = coord[i, 2],
          clockwise = TRUE,
          labels = "",
          col = c("black", "grey", "white"),
          cex = 1.5, radius = 1.5)
```

Some jitter, added by hand:

Create a jitter data frame by hand:

```
# Create a jitter df
jitterDf <- data.frame(x_jitter = rep(0,26), y_jitter = rep(0,26))
rownames(jitterDf) <- rownames(countsDf)
jitterDf[3,] <- c(0,1)
jitterDf[4,] <- c(5,-1)
jitterDf[5,] <- c(1,-1)
jitterDf[6,] <- c(-2,0)
jitterDf[7,] <- c(-4,-1)
jitterDf[8,] <- c(-4,1)
jitterDf[9,] <- c(2,-3)
jitterDf[10,] <- c(5,-1)
jitterDf[15,] <- c(-7,3.5)
jitterDf[17,] <- c(-6,-1.5)
jitterDf[20,] <- c(1,1)
jitterDf[21,] <- c(1,-1)</pre>
```

Calculate bounds of map based on coordinates + jitter:

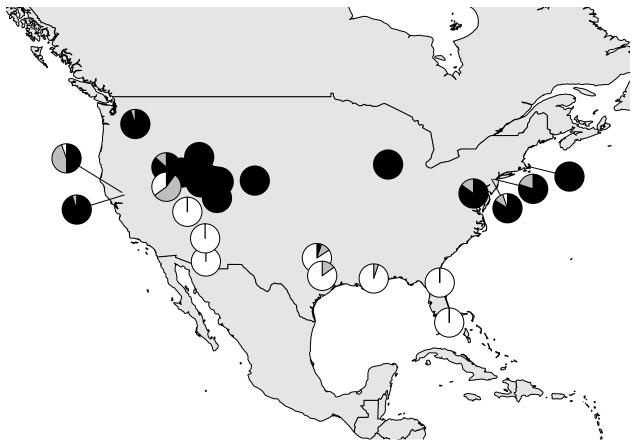

```
# Expand x/y limits by a small margin (e.g., 2 degrees)
x_range <- range(coord[, 1] + jitterDf[, 1], na.rm = TRUE)
y_range <- range(coord[, 2] + jitterDf[, 2], na.rm = TRUE)

x_margin <- 2
y_margin <- 2
x_lim <- c(x_range[1] - x_margin, x_range[2] + x_margin)
y_lim <- c(y_range[1] - y_margin, y_range[2] + y_margin)</pre>
```

Add jitter with a line from true origin:

```
# Open PDF device
#pdf("../figs/ace2_pies_ThisStudy.pdf", width = 8, height = 6)
# Set xpd to NA to allow for plotting in the margins
par(xpd = NA)
# Plot map with expanded margins
map("usa", xlim = x_lim, ylim = y_lim)
map(add = TRUE, col = "grey90", fill = TRUE)
for (i in plot_order) {
  # Jittered coordinates
  jittered_x <- coord[i, 1] + (jitterDf[i, 1])</pre>
 jittered_y <- coord[i, 2] + (jitterDf[i, 2])</pre>
  # Draw line from true location to jittered pie
  segments(x0 = coord[i, 1],
           y0 = coord[i, 2],
           x1 = jittered_x,
           y1 = jittered_y,
           col = "black", lty = 1, lwd = 1)
  # Plot pie chart at jittered location
  add.pie(z = freqsDf[i,],
```

```
x = jittered_x,
y = jittered_y,
clockwise = TRUE,
labels = "",
col = c("black", "grey", "white"),
cex = 1.5, radius = 1.5)
}
```

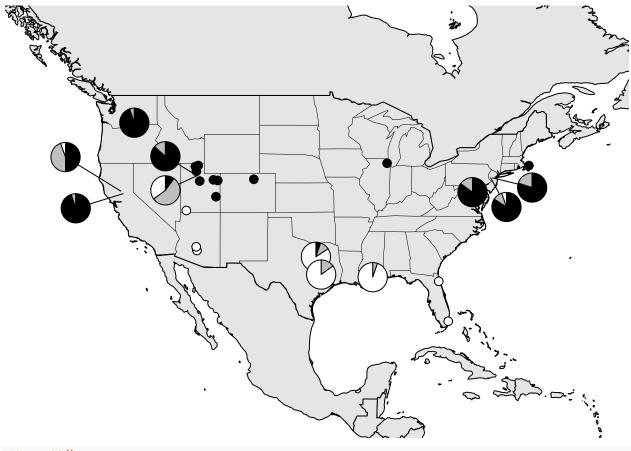

#dev.off()

Add jitter with a line from true origin AND fixed sites as small dots

```
# Open PDF device
#pdf("../figs/ace2_pies_ThisStudy.pdf", width = 8, height = 6)

#ADJUST the jitter df
jitterDf <- data.frame(x_jitter = rep(0,26), y_jitter = rep(0,26))
rownames(jitterDf) <- rownames(countsDf)
#jitterDf[3,] <- c(0,1)
#jitterDf[4,] <- c(5,-1)
#jitterDf[6,] <- c(-2,0)
jitterDf[7,] <- c(-4,-1.5)
jitterDf[8,] <- c(-4,2)
jitterDf[9,] <- c(2,-3)
jitterDf[10,] <- c(5,-1)
jitterDf[15,] <- c(-7,3.5)
```

```
jitterDf[17,] \leftarrow c(-6,-1.5)
#jitterDf[20,] <- c(1,1)
#jitterDf[21,] <- c(1,-1)
# Set xpd to NA to allow for plotting in the margins
par(xpd = NA)
# Add flag for fixed sites and what type of fixed (pp or qq)
freqs_fixed <- freqsDf[, 1] == 1 | freqsDf[, 3] == 1</pre>
freqs_fixed_type <- ifelse(freqsDf[, 1] == 1, "pp",</pre>
                            ifelse(freqsDf[, 3] == 1, "qq", NA))
# Plot map with expanded margins
map("usa", xlim = x_lim, ylim = y_lim)
map(add = TRUE, col = "grey90", fill = TRUE)
map("state", add = TRUE, col = "black", lwd = 0.5)
for (i in plot_order) {
  jittered_x <- coord[i, 1] + (jitterDf[i, 1])</pre>
  jittered_y <- coord[i, 2] + (jitterDf[i, 2])</pre>
  segments(x0 = coord[i, 1],
           y0 = coord[i, 2],
           x1 = jittered_x,
           y1 = jittered_y,
           col = "black", lty = 1, lwd = 1)
  if (freqs_fixed[i]) {
    if (freqs_fixed_type[i] == "pp") {
      # Black dot
      points(jittered_x, jittered_y, pch = 21, bg = "black", col = "black", cex = 1.2)
    } else if (freqs_fixed_type[i] == "qq") {
      # White dot with black border
      points(jittered_x, jittered_y, pch = 21, bg = "white", col = "black", cex = 1.2)
  } else {
    add.pie(z = freqsDf[i,],
            x = jittered_x,
            y = jittered_y,
            clockwise = TRUE,
            labels = "",
            col = c("black", "grey", "white"),
            cex = 1.5, radius = 1.5)
  }
}
```

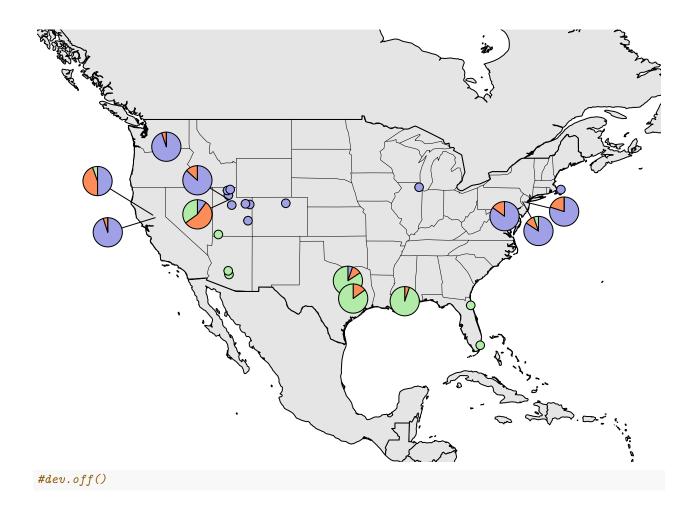

#dev.off()

Plot using colors from SDM:

```
# Open PDF device
#pdf("../figs/ace2_pies_rgb_ThisStudy.pdf", width = 8, height = 6)
#ADJUST the jitter df
jitterDf <- data.frame(x_jitter = rep(0,26), y_jitter = rep(0,26))</pre>
rownames(jitterDf) <- rownames(countsDf)</pre>
#jitterDf[3,] <- c(0,1)
#jitterDf[4,] \leftarrow c(5,-1)
#jitterDf[5,] <- c(1,-1)
\#jitterDf[6,] \leftarrow c(-2,0)
jitterDf[7,] \leftarrow c(-4,-1.5)
jitterDf[8,] \leftarrow c(-4,2)
jitterDf[9,] \leftarrow c(2,-3)
jitterDf[10,] \leftarrow c(5,-1)
jitterDf[15,] \leftarrow c(-7,3.5)
jitterDf[17,] \leftarrow c(-6,-1.5)
#jitterDf[20,] <- c(1,1)
#jitterDf[21,] <- c(1,-1)
# Set xpd to NA to allow for plotting in the margins
par(xpd = NA)
# Add flag for fixed sites and what type of fixed (pp or qq)
```

```
freqs_fixed <- freqsDf[, 1] == 1 | freqsDf[, 3] == 1</pre>
freqs_fixed_type <- ifelse(freqsDf[, 1] == 1, "pp",</pre>
                            ifelse(freqsDf[, 3] == 1, "qq", NA))
# Plot map with expanded margins

 $\#ggsave("../figs/h_index_lm_This_by_neon.pdf", \ plot = final_plot, \ width = 7, \ height = 4, \ units = "in")$

Because our new field dataset is small, most NEON ecozones have few samples (often n < 3), which yields unstable fits; we therefore present primary results by broader East/West/Central/Mountain zones where inference is more robust.
